PMA Lab 1.3 Writeup

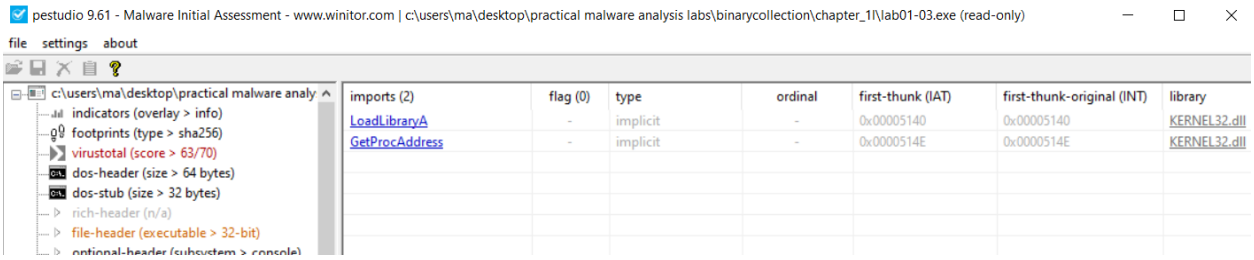

https://www.linkedin.com/in/talha-yaqoob

1. **Upload the Lab01-03.exe file to http://www.VirusTotal.com/. Does it match any existing antivirus definitions?**

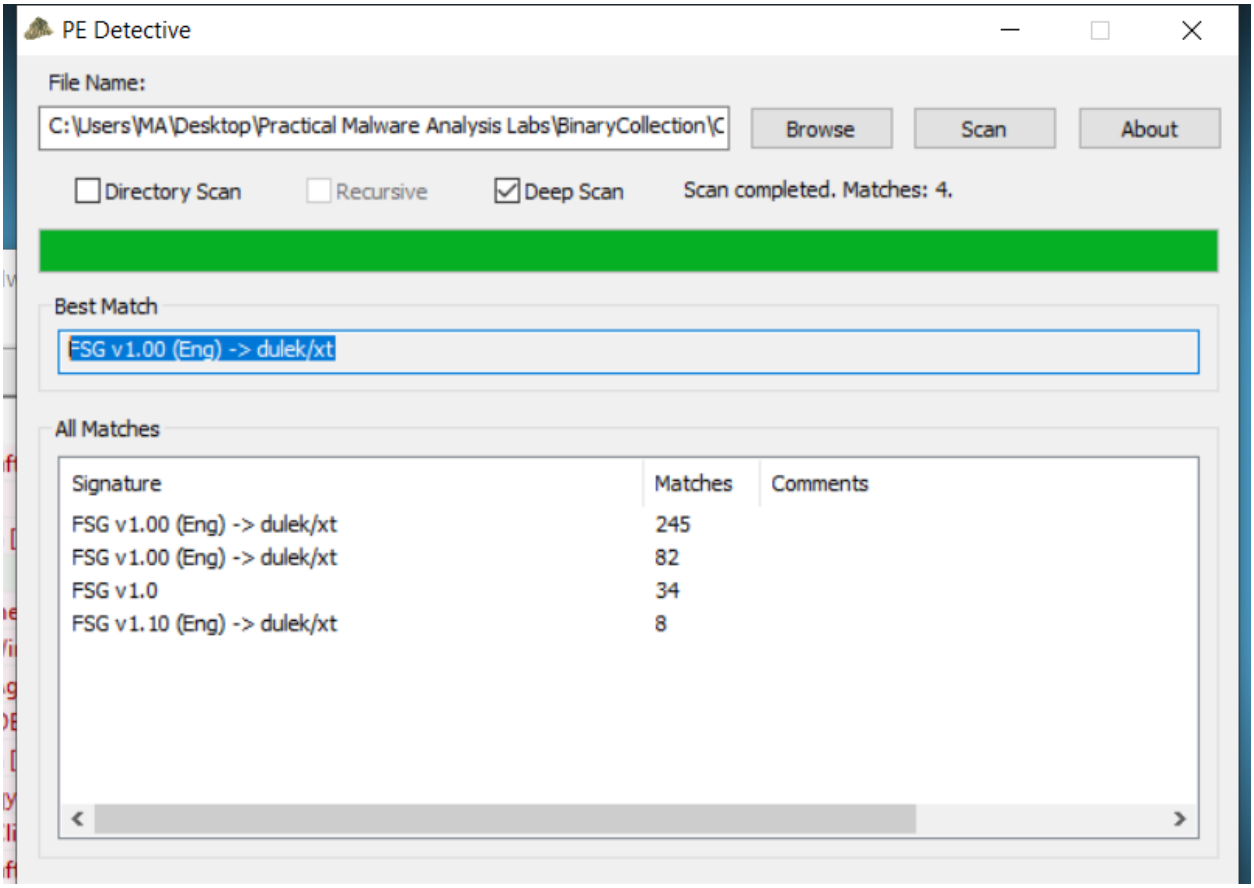

2. **Are there any indications that this file is packed or obfuscated? If so, what are these indicators? If the file is packed, unpack it if possible.**

Abnormal number of imports for a file being malicious

The value of entropy confirms it.

The PE detective shows that it is packed by FSG .

So I installed a tool named unpacker which supports the unpacking of the FSG packed exe (supported on old python version)

Created a virtual environment for it and unpacked the file

3. **Do any imports hint at this program's functionality? If so, which imports are they and what do they tell you?**

COM objects expose **hidden functionality**—or more accurately, **pre-built, advanced operating system functions**—that are accessible to any program, including malware.

This malware is trying to Interact with COM by creating its own object and will be trying to get functionalities from COM allowing it to interact back to its URL. Possibly downloading the file or just opening it upon execution,A threat indeed
